

UFW Assignment - Questions and Answers

Question 1: Install ufw on your Linux system (if not already installed) and enable it, then verify its status using the appropriate commands.

Answer:

```
sudo apt update
sudo apt install ufw -y
sudo ufw enable
sudo ufw status verbose
```

Question 2: Configure ufw to allow incoming SSH connections only on port 22 and block all other incoming connections.

Answer:

```
sudo ufw default deny incoming
sudo ufw allow 22/tcp
sudo ufw reload
sudo ufw status numbered
```

Question 3: Add a rule in ufw to allow outgoing HTTP and HTTPS traffic (ports 80 and 443), but block all other outbound connections.

Answer:

```
sudo ufw default deny outgoing
sudo ufw allow out 80/tcp
sudo ufw allow out 443/tcp
sudo ufw reload
sudo ufw status verbose
```

Question 4: List all currently active ufw rules on your system and save the output to a file named firewall_rules.txt.

Answer:

```
sudo ufw status numbered
sudo ufw status numbered > firewall_rules.txt
cat firewall_rules.txt
```

Question 5: Write a short explanation (3-4 lines) describing how your current ufw configuration would impact running a local web server.

Answer:

The current UFW configuration allows only SSH access on port 22 and blocks all other incoming connections. A local web server running on ports such as 80, 443, or 8080 will not be accessible from external users unless those ports are explicitly allowed. The server can make outbound HTTP and HTTPS connections, while all other outbound traffic remains blocked. This improves security but prevents public access to the web application.
